

# Our color wheel

The color wheel is our tool for understanding which colors go with what.

# Our color wheel

Part science, part art, the color wheel is our tool for understanding which colors go with what.

Wherever there is light, there is color. While we think of colors as independent—this blue, that red—a color is never seen alone but always

in the context of other colors. Like a musical note, no one color is “good” or “bad.” Rather, it’s one part of a composition that *as a whole* is pleasing or not. The color wheel is our tool for understanding how colors relate to one another. Here’s how it works.

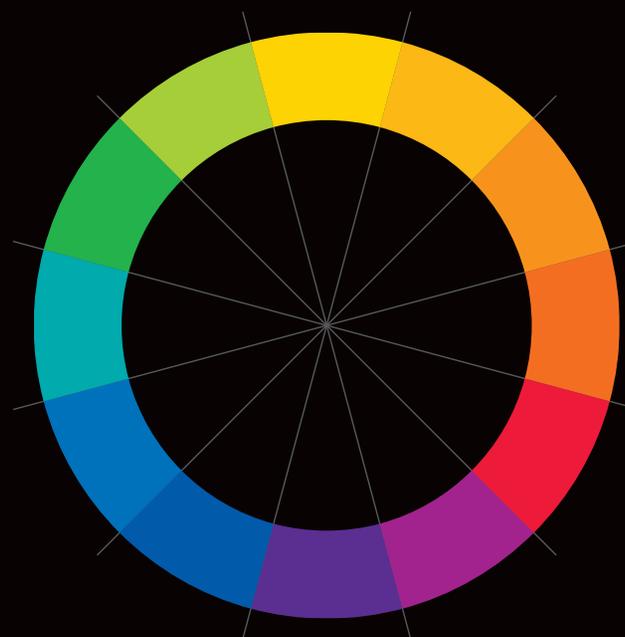

## Infinity, simplified

White light contains all visible colors, which form an infinite spectrum that always appears in the violet-to-red sequence you see in a rainbow (right, top). To make it practical, the color wheel represents this infinity with 12 basic hues pretty much like those in your first box of crayons.

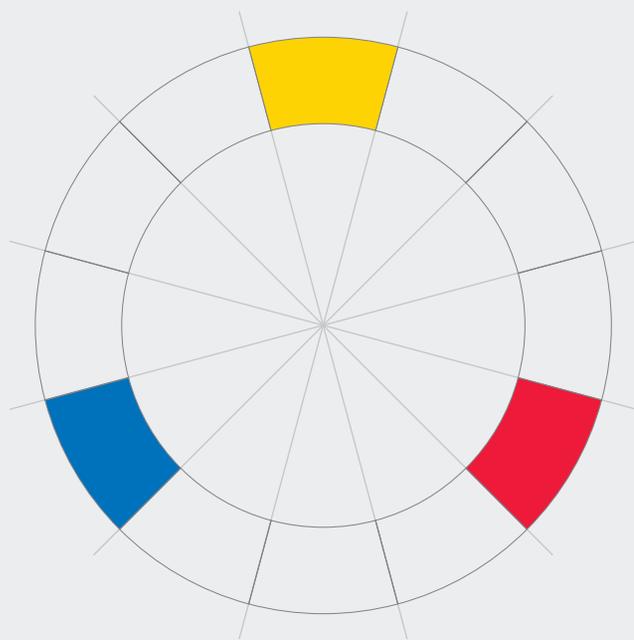

The color wheel is the range of visible light made into a circle.

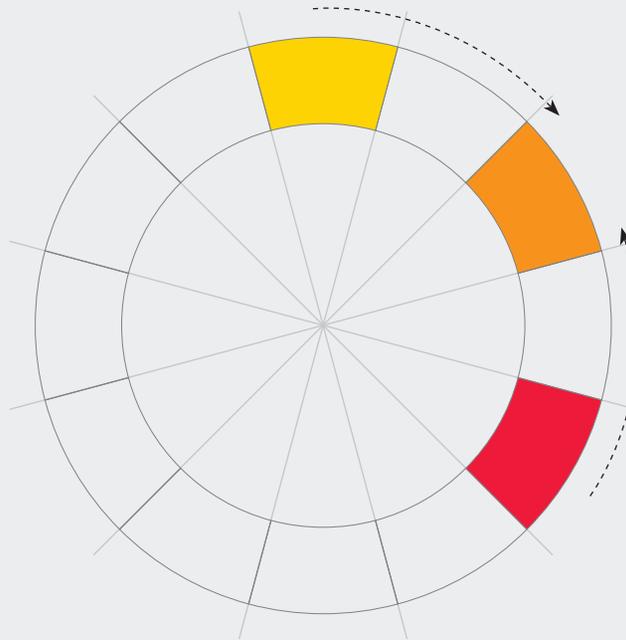

## What are the colors?

The wheel has 12 basic hues. First are the three *primary* colors of blue, yellow and red.

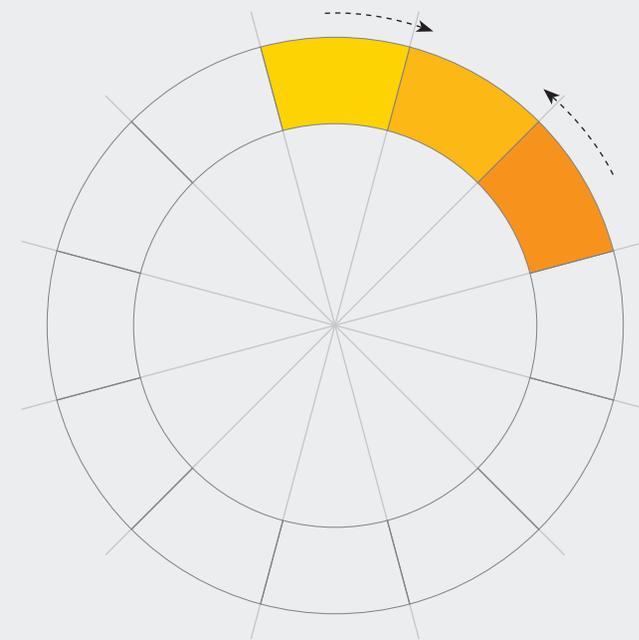

Primary colors combine to make *secondary* colors, which combine to make *tertiary* colors.

**Primary colors** are the wheel's "parent" colors; they are the only colors not made from other colors. The primary colors are positioned around the wheel in thirds.

**Secondary colors** are halfway between the primary colors. Each is made from equal amounts of the nearest primaries.

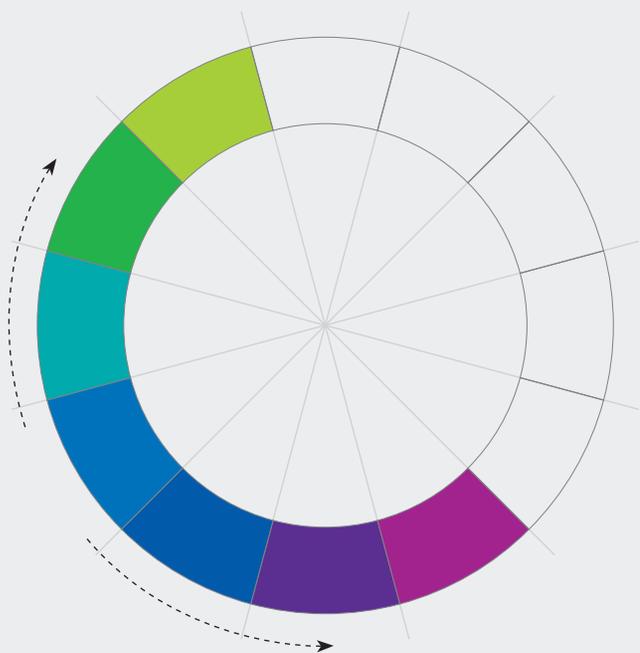

**Tertiary colors** are halfway between the secondary colors. Each is made from equal amounts of the adjacent secondaries.

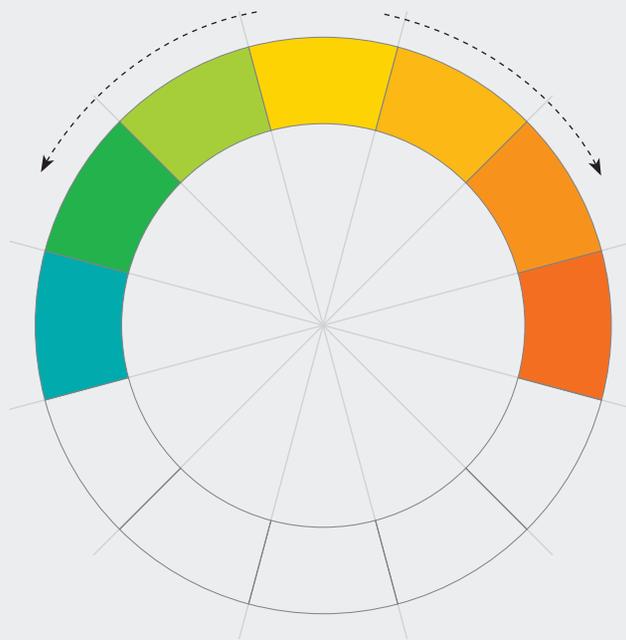

## Colors in common

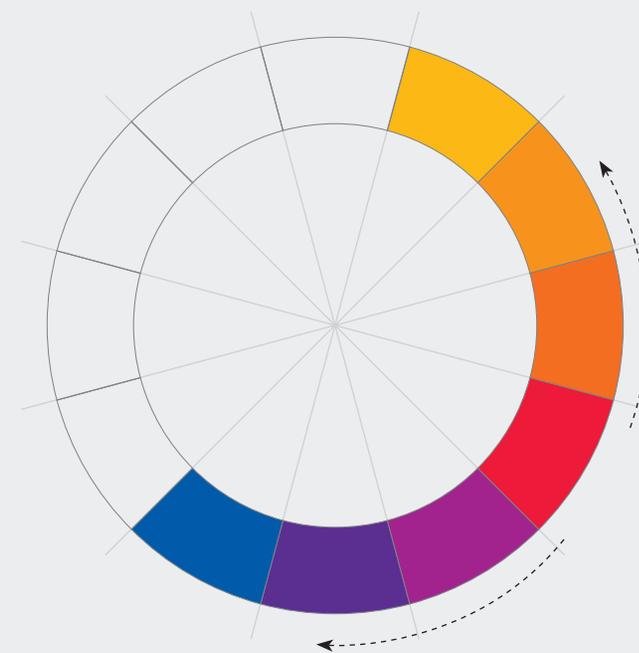

As you can tell, every color is part of the color next to it, which is part of the next and the next, all the way around the wheel. *Colors in common* are the basis of color relationships.

**Blue is common** to all seven colors, which get less blue as they fan out. Green and violet are the secondaries that contain blue.

**Yellow is common** to all seven colors, which get less yellow as they fan out. Green and orange are the secondaries that contain yellow.

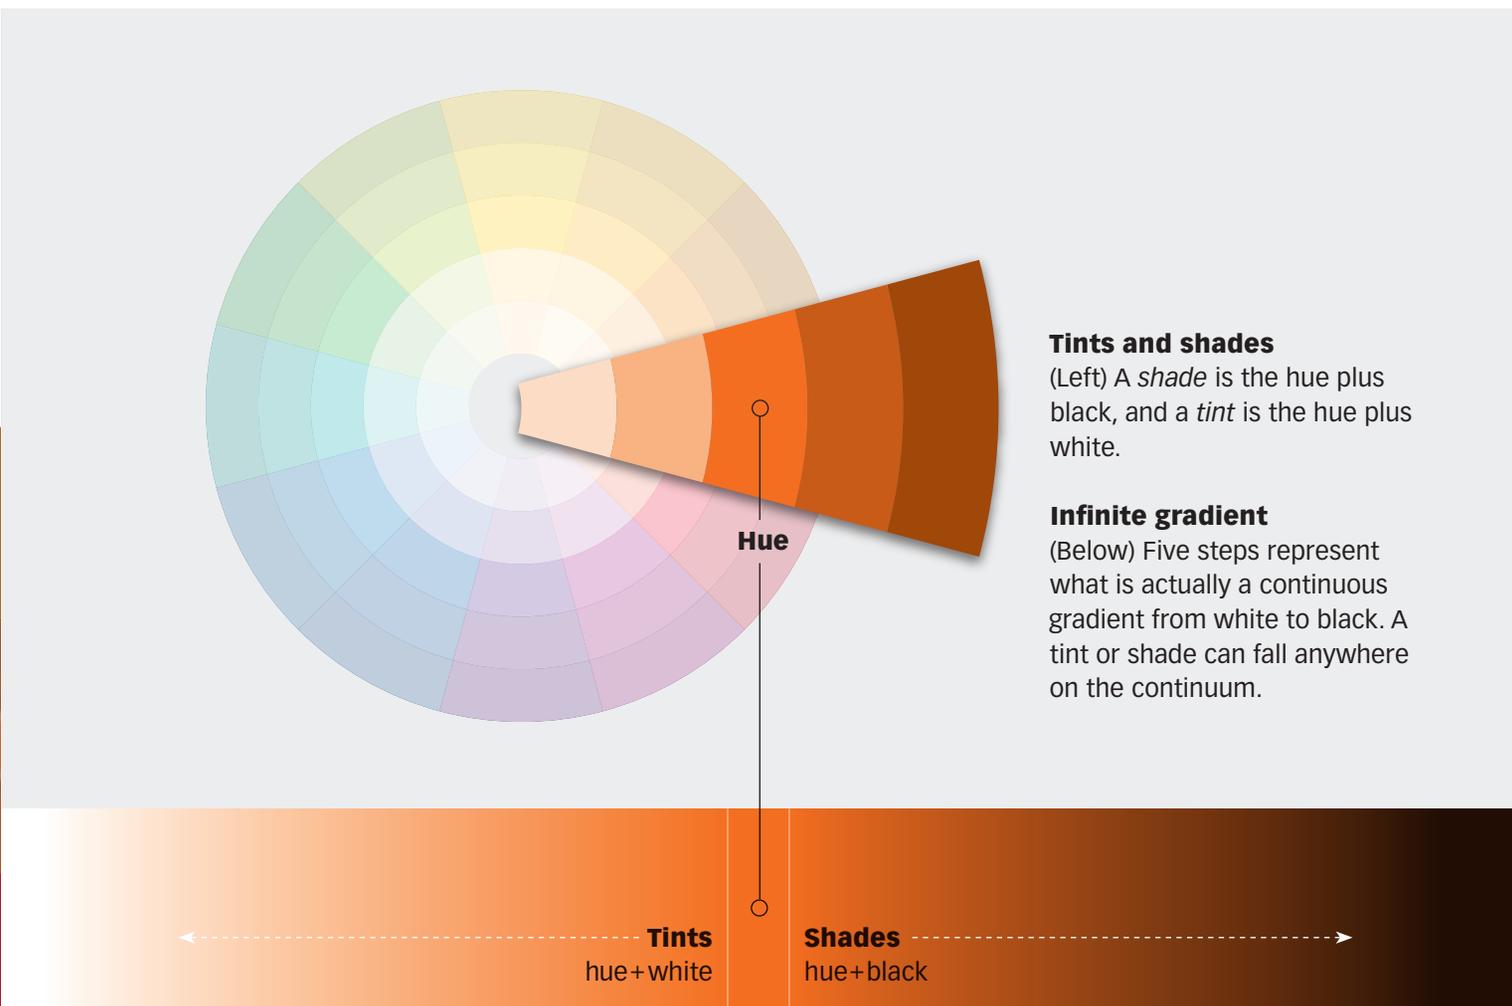

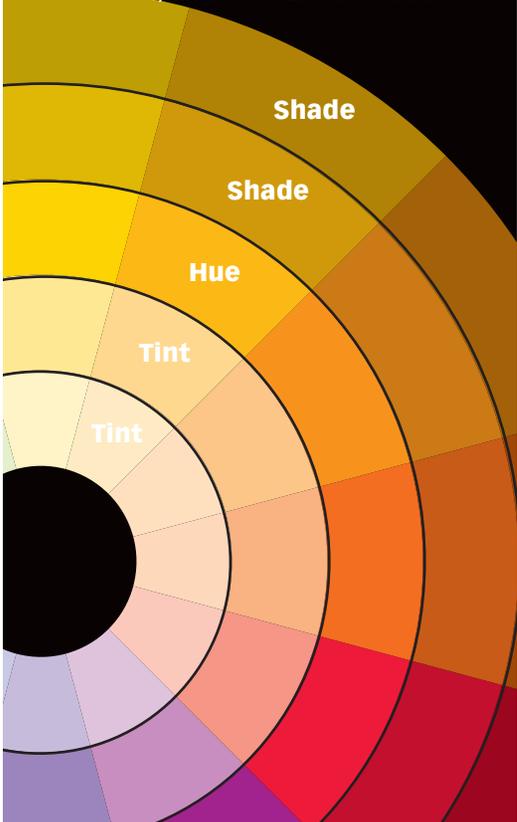

**Red is common** to all seven colors, which get less red as they fan out. Orange and violet are the secondaries that contain red.

### Color value

Color also has darkness and lightness, or *value*. To show value, the color wheel has more rings; two big rings for the dark *shades* and two small rings for the light *tints*.

**The color wheel** has five concentric rings from dark to light—shades are the big rings, tints are the small, and hues are the middle.

#### Tints and shades

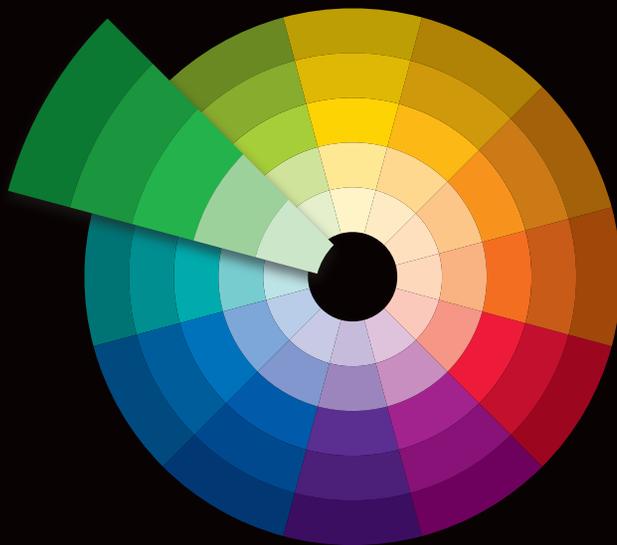

(Left) A *shade* is the hue plus black, and a *tint* is the hue plus white.

#### Infinite gradient

(Below) Five steps represent what is actually a continuous gradient from white to black. A tint or shade can fall anywhere on the continuum.

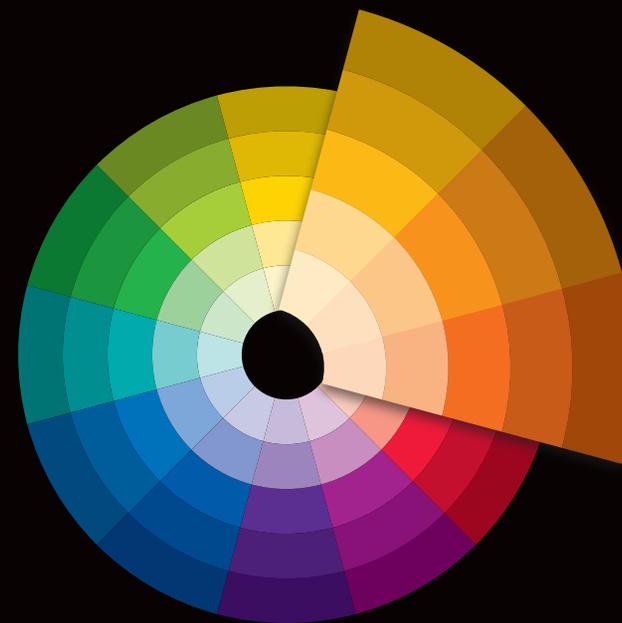

## Color relationships

The following pages illustrate the six basic color relationships. Each can yield an endless number of color palettes.

### Monochromatic

First are the dark, medium and light values of a single color. This is a monochromatic palette. It has no color depth, but it provides the contrast of dark, medium and light that's so important to good design.

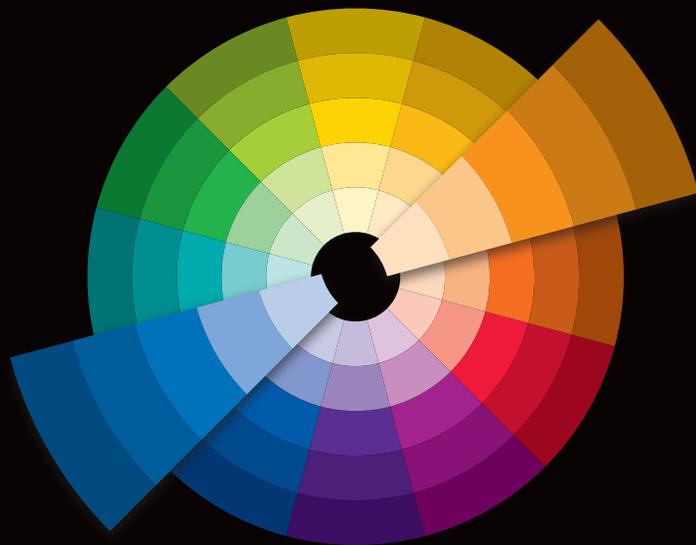

### Analogous

Adjacent colors are called analogous. Analogous colors share strong undertones (here, yellow and red), which create pleasing, low-contrast harmony. Analogous palettes are rich and always easy to work with.

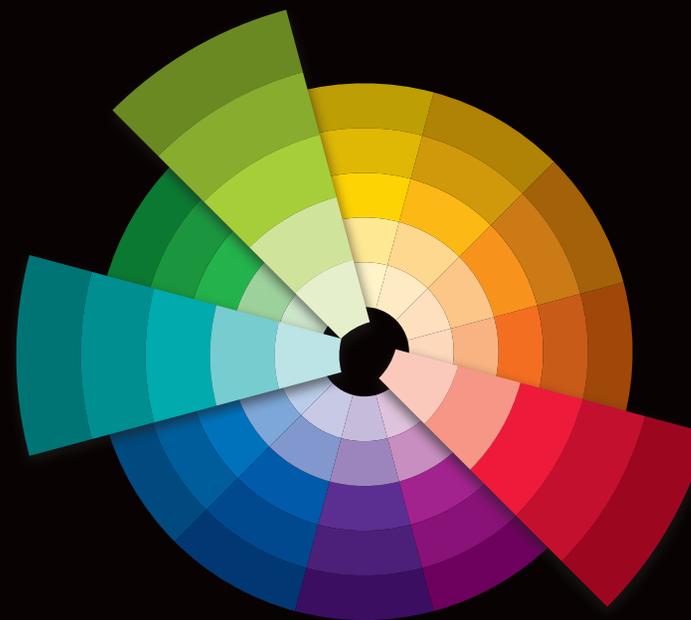

Any palette can include shades and tints along with the hue. The result can be all dark, all light, or any combination.

### Complement

Direct opposites on the color wheel are complements—in this case, blue and orange. What the complement brings is *contrast*. A color and its complement convey energy, vigor and excitement. Typically, the complement is used in a smaller amount as an accent; a spot of orange on a blue field, for example.

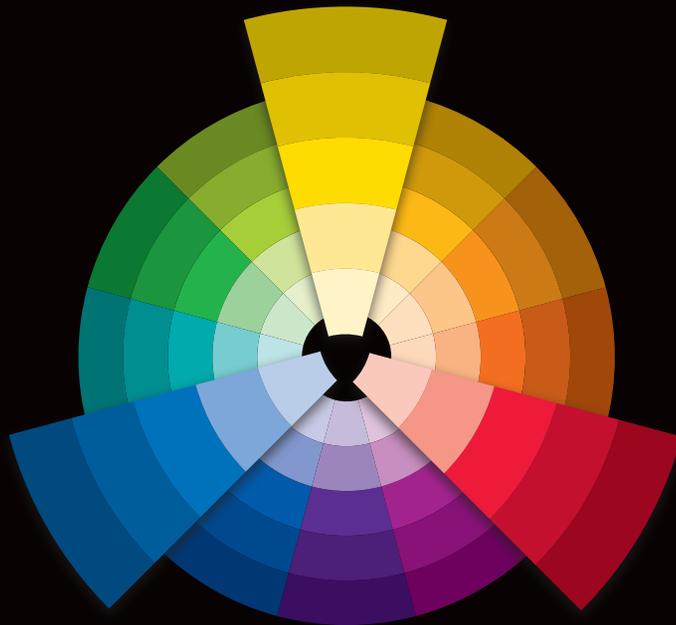

### Split complement

One step either way are the complement's own analogous colors. This palette is called a split complement. Its strength is in the low-contrast beauty of analogous colors, plus the added punctuation of an opposite color. In this case the red, because it's most different, would likely be used as the accent.

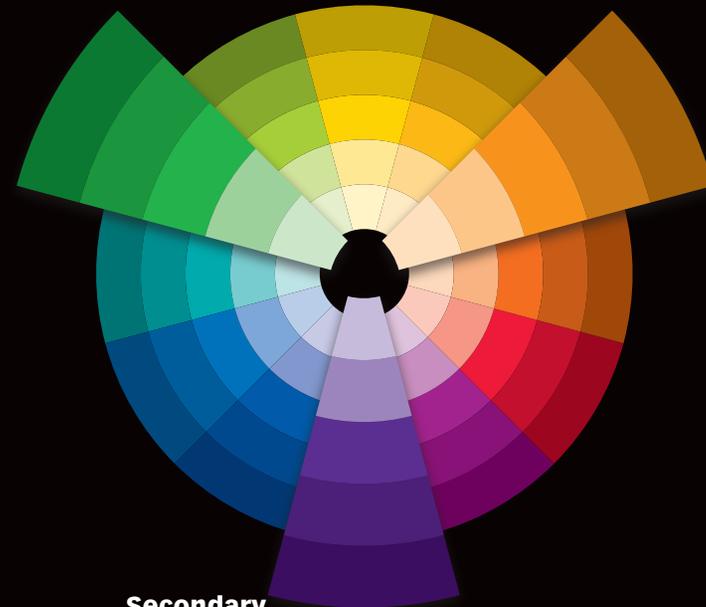

The amount of color matters. Palettes can be made warmer/cooler, darker/lighter, stronger/quieter and so on by using more or less of some colors.

**Primary**

The primary colors are rarely seen as a trio except in children's products. Red and yellow, however, are popular in American culture for everything from fast food to gasoline. Red and blue are common but attractive only if separated by open space.

**Secondary**

Secondary colors have a lot in common—two share blue, two share yellow, and two share red—so harmonize easily. As a trio they are soft, inviting and rich, and have pleasing depth and dimension that are hard to get in other ways.
